Introduction

ytube is a video-sharing web application where people can watch, upload, and discuss videos. It provides a simple viewing experience and tools for creators to manage their channels.

Objective

The project aims to build an easy-to-use video platform with useful community features and safer discussions.

Main Features

- Browse and search videos, explore categories, and watch videos with playback controls.
- Create a channel, upload videos and thumbnails, and manage content in the creator studio.
- Save videos to playlists or Watch later, follow channels, and view watch history and liked videos.
- Post threaded comments in different languages and translate them to a preferred language.
- Like, dislike, edit, delete, sort, and report comments. Moderators can review reports and keep action records.
- Reduce spam and abuse with comment filters, duplicate checks, posting limits, and a human check after repeated attempts.

Technology Used

The interface uses React and TypeScript. The application uses Cloudflare D1 for data and R2 for uploaded media. It can run locally with a launcher or in Docker for sharing.

Conclusion

ytube combines video discovery, creator tools, and multilingual community discussion in one application. Its reporting and moderation tools help support a safer user experience.
